Duration	20 mins 15 secs
Grade	**9.00** out of 10.00 (**90**%)

Question **1**

Correct

Mark 1.00 out of 1.00

Develop a Python program to copy the contents of one file to another file.

Description:

1. **Input:**
   - Source file and destination file names.
2. **Output:**
   - The content of the source file copied to the destination file.

For example:

Test	Input	Result

`with open('output1.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`output1.txt`
		`This is the source file.`
		`It contains multiple lines of text.`
		`Here is another line.`

Answer: (penalty regime: 0 %)

```
source = input()
destination = input()

with open(source, 'r') as src:
    content = src.read()

with open(destination, 'w') as dest:
    dest.write(content)
```

	Test	Input	Expected	Got	

✓	`with open('output1.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input1.txt`
		`output1.txt`
			`This is the source file.`
			`It contains multiple lines of text.`
			`Here is another line.`
				`This is the source file.`
				`It contains multiple lines of text.`
				`Here is another line.`
					✓

✓	`with open('output2.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input2.txt`
		`output2.txt`
			`Hello, world!`
			`Python programming is amazing.`
			`Let's copy this text to another file.`
				`Hello, world!`
				`Python programming is amazing.`
				`Let's copy this text to another file.`
					✓

✓	`with open('output3.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input3.txt`
		`output3.txt`
			`Single line.`	`Single line.`	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **2**

Correct

Mark 1.00 out of 1.00

Create a Python program to find the longest word in a text file.

- **Input:**
  - A text file containing multiple lines of text.
- **Output:**
  - The longest word in the file.

For example:

Input	Result
input1.txt	Longest word: containing

Answer: (penalty regime: 0 %)

```
filename = input()

with open(filename, 'r') as file:
    text = file.read()

words = text.split()
longest = max(words, key=len)

print("Longest word:", longest)
```

	Input	Expected	Got	
✓	input1.txt	Longest word: containing	Longest word: containing	✓
✓	input2.txt	Longest word: thousand	Longest word: thousand	✓
✓	input3.txt	Longest word: supercalifragilisticexpialidocious	Longest word: supercalifragilisticexpialidocious	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **3**

Correct

Mark 1.00 out of 1.00

Develop a Python program to read a text file and count the total number of words in the file.

Description:

1. **Input:**
   - A text file containing several lines of text.
   - File name you should get as input.
2. **Output:**
   - The total number of words in the file.

For example:

Input	Result
input2.txt	Total words: 14
input3.txt	Total words: 15

Answer: (penalty regime: 0 %)

```
filename = input()

with open(filename, 'r') as file:
    text = file.read()

words = text.split()
print("Total words:", len(words))
```

	Input	Expected	Got	
✓	input1.txt	Total words: 6	Total words: 6	✓
✓	input2.txt	Total words: 14	Total words: 14	✓
✓	input3.txt	Total words: 15	Total words: 15	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **4**

Correct

Mark 1.00 out of 1.00

Write a Python program to append a new line at a specific position in a text file, shifting existing lines down.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to insert the new line at.
   - New content for the new line.
2. **Output:**
   - The updated file with the new line inserted at the specified position, shifting the existing lines down in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  3

  Inserted line..

Output:

Line one.
Line two.
Inserted line.
Line three.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`3`
	`Inserted line.`
		`Line one.`
		`Line two.`
		`Inserted line.`
		`Line three.`
		`Line four.`

Answer: (penalty regime: 0 %)

```
filename = input().strip()
line_number = int(input())
new_line = input().strip()

with open(filename, 'r') as file:
    lines = file.read().splitlines()

lines.insert(line_number - 1, new_line)

with open('output.txt', 'w') as file:
    file.write('\n'.join(lines) + '\n')
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt
		3
		Inserted line.
			Line one.
			Line two.
			Inserted line.
			Line three.
			Line four.
				Line one.
				Line two.
				Inserted line.
				Line three.
				Line four.
					✓

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input2.txt
		4
		Inserted line D.
			Line A.
			Line B.
			Line C.
			Inserted line D.
				Line A.
				Line B.
				Line C.
				Inserted line D.
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **5**

Correct

Mark 1.00 out of 1.00

Create a Python program to delete a specific line from a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to delete.
2. **Output:**
   - The updated file with the specified line removed in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  2

  Updated line two.

Output:

Line one.
Line three.
Line four.

For example:

Test	Input	Result
with open('output.txt', 'r') as file: text = file.read() print(text)	input1.txt 2	Line one. Line three. Line four.

Answer: (penalty regime: 0 %)

```
filename = input().strip()
line_number = int(input())

with open(filename, 'r') as file:
    lines = file.read().splitlines()

if 1 <= line_number <= len(lines):
    del lines[line_number - 1]

with open('output.txt', 'w') as file:
    file.write('\n'.join(lines))
    if lines:
        file.write('\n')
```

	Test	Input	Expected	Got	
✓	with open('output.txt', 'r') as file: text = file.read() print(text)	input1.txt 2	Line one. Line three. Line four.	Line one. Line three. Line four.	✓

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input2.txt
		3
			Line A.
			Line B.
				Line A.
				Line B.
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **6**

Correct

Mark 1.00 out of 1.00

Write a Python program to reverse the contents of a specific line in a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to reverse.
2. **Output:**
   - The updated file with the specified line's contents reversed in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  3

Output:

Line one.
Line two.
eerht eniL.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	3
		Line one.
		Line two.
		eerht eniL.
		Line four.

Answer: (penalty regime: 0 %)

```
import sys
import string

def reverse_specific_line(input_filename, line_number, output_filename="output.txt"):
    with open(input_filename, 'r') as file:
        lines = file.readlines()

    target_index = line_number - 1

    if 0 <= target_index < len(lines):
        line = lines[target_index]

        # Check for trailing newline
        has_newline = line.endswith('\n')
        if has_newline:
            line = line[:-1]

        # Strip trailing punctuation so it doesn't end up at the front after reversal
        trailing_punctuation = ""
        while line and line[-1] in string.punctuation:
            trailing_punctuation = line[-1] + trailing_punctuation
            line = line[:-1]

        # Reverse the core content and append punctuation + newline back to the end
        reversed_line = line[::-1] + trailing_punctuation
        if has_newline:
            reversed_line += '\n'

        lines[target_index] = reversed_line

    with open(output_filename, 'w') as file:
        file.writelines(lines)
```

```
33
34 if __name__ == "__main__":
35     input_data = sys.stdin.read().splitlines()
36     if len(input_data) >= 2:
37         file_path = input_data[0].strip()
38         target_line = int(input_data[1].strip())
39
40         reverse_specific_line(file_path, target_line)
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt
		3
			Line one.

					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **7**

Correct

Mark 1.00 out of 1.00

Create a Python program to write to a specific line in a text file, replacing the existing content of that line.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to write to.
   - New content for the specified line.
2. **Output:**
   - The updated file with the specified line replaced by the new content in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  2

  Updated line two.

Output:

Line one.
Updated line two.
Line three.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`2`
	`Updated line two.`
		`Line one.`
		`Updated line two.`
		`Line three.`
		`Line four.`

Answer: (penalty regime: 0 %)

```
import sys

def replace_line_in_file():
    # Read inputs from standard input
    input_data = sys.stdin.read().splitlines()
    if len(input_data) < 3:
        return

    input_filename = input_data[0].strip()
    line_number = int(input_data[1].strip())
    new_content = input_data[2]  # Keep leading/trailing spaces if present

    # Read all lines from the input file
    with open(input_filename, 'r') as file:
        lines = file.readlines()

    # Convert 1-based line number to 0-based index
    target_index = line_number - 1

    # Replace the target line if it exists within range
    if 0 <= target_index < len(lines):
        # Check if the original line had a trailing newline
        if lines[target_index].endswith('\n') or target_index < len(lines) - 1:
            lines[target_index] = new_content + '\n'
        else:
            lines[target_index] = new_content

    # Write the updated content to output.txt
    with open('output.txt', 'w') as file:
```

```
        file.writelines(lines)

if __name__ == "__main__":
    replace_line_in_file()
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt
		2
		Updated line two.
			Line one.
			Updated line two.
			Line three.

Question **8**

Incorrect

Mark 0.00 out of 1.00

Write a Python program to count the frequency of each word in a given text file.

Description:

1. **Input:**
   - String as input.
2. **Output:**
   - A list of words with their corresponding frequency count to be write in a file "output.txt"

Example:

- **Input File Content:**

  apple orange apple banana apple orange

Output:

apple: 3
orange: 2
banana: 1

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`apple orange apple banana apple orange`	`apple: 3`
		`banana: 1`
		`orange: 2`

Answer: (penalty regime: 0 %)

```
from collections import Counter

text = input().split()
freq = Counter(text)

with open("output.txt", "w") as file:
    for word in sorted(freq):
        file.write(f"{word}: {freq[word]}\n")
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r')`
	`as file:`
	`  text = file.read()`
	`  print(text)`
		`apple orange apple banana apple orange`	`apple: 3`
			`banana: 1`
			`orange: 2`
				`apple: 3`
				`banana: 1`
				`orange: 2`
					✓

	Test	Input	Expected	Got	

✗	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`Hello world! Hello everyone. Welcome to the world of programming.`	`everyone: 1`
			`hello: 2`
			`of: 1`
			`programming: 1`
			`the: 1`
			`to: 1`
			`welcome: 1`
			`world: 2`
				`Hello: 2`
				`Welcome: 1`
				`everyone.: 1`
				`of: 1`
				`programming.: 1`
				`the: 1`
				`to: 1`
				`world: 1`
				`world!: 1`

Marks for this submission: 0.00/1.00.

Question **9**

Correct

Mark 1.00 out of 1.00

Develop a Python program to identify and print all palindrome words from a given text file.

Description:

1. **Input:**
   - A text file containing multiple words.
2. **Output:**
   - A list of palindrome words found in the file name as 'output.txt'.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt	madam
		arora
		malayalam

Answer: (penalty regime: 0 %)

```
filename = input().strip()

with open(filename, 'r') as file:
    words = file.read().split()

with open('output.txt', 'w') as file:
    for word in words:
        if word.lower() == word.lower()[::-1]:
            file.write(word + '\n')
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt	madam
			arora

Question **10**

Correct

Mark 1.00 out of 1.00

Develop a Python program to read a specific line from a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to read.
2. **Output:**
   - The content of the specified line.

input1.txt:

Line one.
Line two.
Line three.
Line four.

For example:

Input	Result
input1.txt 3	Line three.

Answer: (penalty regime: 0 %)

```
filename = input().strip()
line_number = int(input())

with open(filename, 'r') as file:
    lines = file.readlines()

if 1 <= line_number <= len(lines):
    print(lines[line_number - 1].strip())
```

	Input	Expected	Got	
✓	input1.txt 3	Line three.	Line three.	✓
✓	input2.txt 3	Line C.	Line C.	✓
